

Jagadish, K.

Principal Engineer · Software Architecture · AI Systems · Platform Engineering
Bengaluru, Karnataka, India | +91-9916128366 | jagadish.kasi@pm.me | linkedin.com/in/jagadish-kasi | github.com/jagadish-k

Principal Engineer and hands-on technical leader with **18 years of experience designing, building, and evolving complex software platforms** across LinkedIn, Walmart, Cleartax, Uberall, and startups.

I operate across **software architecture, distributed systems, platform engineering, developer infrastructure, and AI systems**, with a track record of turning ambiguous technical problems into scalable platforms and measurable business outcomes.

Currently CTO and co-founder of Tryft, leading a 6-engineer team building an enterprise supply-chain intelligence platform that has **surfaced \$2-3M per quarter** in recoverable revenue across global manufacturing operations.

Previously led frontend architecture across a **30+ engineer organization spanning 8 countries** at Uberall and built ML evaluation and API discovery platforms used across LinkedIn engineering.

SELECTED IMPACT

- \$2-3M / quarter** - Recoverable revenue surfaced through an enterprise supply-chain intelligence platform.
- 30,000+ materials / tenant** - AI-assisted inventory analysis across large-scale manufacturing datasets.
- 30+ engineers · 8 countries** - Technical leadership and frontend architecture across a globally distributed engineering organization.
- 500M store-item forecasts** - Data-intensive forecasting platform built for Walmart demand-management operations.
- 800+ node graphs · 60 FPS** - Spatial virtualization architecture enabling interactive large-scale material lineage-based workflows.

EXPERIENCE

- Tryft (CTO & Co-founder, Remote)
Enterprise supply-chain intelligence · AI systems · Platform architecture
Product & Technical Leadership

May 2024 - Present

Surfaced \$2-3M per quarter in recoverable revenue by architecting, developing and scaling **Traceflow** - an enterprise supply-chain intelligence platform deployed across global manufacturing operations, supporting **~300 business users** and datasets exceeding **30,000 materials per tenant**.

Lead a 6-engineer product team across backend, frontend, and QA, while remaining hands-on across system architecture, implementation, technical decisions, code reviews, and production delivery.

Created R&D cost attribution where none previously existed by designing a project-tracking and material-lineage system connecting revisions, research phases, experimentation, and discovery costs previously scattered across emails and unstructured notes.

Architecture & Engineering

Reduced API integration lead time from weeks to a day by designing a contract-first pipeline that converts GraphQL and OpenAPI specifications into mock services, Zod schemas, TypeScript types, and React Query hooks.

Enabled interactive performance across graphs exceeding 800 nodes by engineering a spatial virtualization layer using 9-grid viewport partitioning and predictive preloading for complex material lineage and Bill of Materials workflows.

Enabled zero-downtime production delivery by designing a Node.js/Next.js BFF platform with Docker, PM2 hot/cold deployments, Azure Front Door traffic switching, and automated Jest, React Testing Library, Cypress, and Playwright quality gates.

Designed tenant-aware authorization architecture using JWT claims and ABAC to enforce route, action, and capability boundaries across differentiated tenant roles.

AI & Agentic Engineering

Established an agentic software-development workflow supporting Claude Code, OpenCode, Cursor, multiple LLM providers, and Model Context Protocol (MCP) servers connected to documentation, design systems, browser automation, and production telemetry.

Integrated LLM-based analysis into daily inventory operations across 30,000+ materials, using Azure OpenAI to classify demand, risk, and staleness and convert large datasets into actionable operator signals and executive summaries.
- Uberall (Principal Frontend Engineer, Remote)
Global SaaS platform · Technical leadership · Application architecture

August 2022 - April 2024

Provided technical leadership to a 30+ engineer frontend organization across 8 countries, defining architecture standards, technical-debt priorities, engineering practices, and quality gates across distributed teams.

Moved frontend/backend contract failures from runtime to compile time by driving organization-wide TypeScript adoption and automated client generation from OpenAPI specifications.

Reduced API complexity at the application boundary by designing Node.js BFF services that consolidated fragmented backend APIs into contracts shaped around application requirements.

Accelerated delivery of high-priority initiatives by embedding directly with engineering teams to resolve architectural bottlenecks, guide technical decisions, govern code reviews, and establish reusable patterns.

Modernized a fragmented frontend architecture by leading the migration from Backbone.js and its adapter layers toward a shared React component architecture and standardized application patterns.

Unified 8 SaaS applications into a single application platform by architecting a micro-frontend system using Webpack Module Federation and a central application shell.

Established frontend architecture standards for 60+ developers by designing the enterprise component library and application boilerplate around React, TypeScript, Ant Design, and Storybook.

Improved platform responsiveness to 90+ Lighthouse scores by addressing API routing, network latency, rendering behavior, layout stability, and loading strategies.

Eliminated duplicated platform capabilities across applications by centralizing authentication sessions, permissions, dynamic configuration, and plan entitlements within the application shell.

Established an inner-source contribution model for the Frontend Platform team, enabling engineers across product teams to contribute and consume shared platform capabilities.

OptimeeringAqua (Freelance, Remote)

October 2020 - January 2021

Built the core frontend for bioplan.ai, an AI-driven aquaculture production planning platform used by fish farming operations across Norway, designing data-dense dashboards that translate optimization model outputs into actionable telemetry.

LinkedIn (Senior Software Engineer, Bengaluru)

May 2019 - September 2020

ML platforms · Developer infrastructure · Internal engineering systems

Built LinkedIn's ML model evaluation platform, enabling data science teams across the engineering organization to evaluate model effectiveness across revisions, track historical progression of serialized model artifacts, and validate candidate models against representative production data.

Built an organization-wide API discovery platform with searchable catalog, interactive playground, autocomplete, tagging, and faceted search, making internal APIs easier to discover and integrate across engineering teams.

Extended internal code-review and CI/CD infrastructure with automated code-health metrics and review validations integrated directly into pull-request workflows.

Walmart (Senior Software Engineer, Bengaluru)

May 2016 - May 2019

Large-scale forecasting · Platform architecture · Data applications

Architected the BFF and UI for Walmart's Smart Forecasting platform, giving demand managers visibility and manual override capabilities across approximately 500 million store-item forecasts and tens of billions of historical and projected data points.

Established an early micro-frontend architecture for business applications of Sam's Club, designing a shell-based platform hosting 6 independent business applications communicating through an in-browser event bus, backed by Node.js BFF services aggregating supply-chain data.

Established frontend modernization standards for AngularJS-to-React migration, providing architectural patterns for teams transitioning large legacy applications to React.

Built interfaces for Walmart's internal Data Lake platform, including configurable data visualization and interactive ETL pipeline builders, and mentored engineers in end-to-end Cypress testing practices.

EARLY CAREER

Snapwiz (Lead Software Engineer, Bengaluru)

February 2015 - May 2016

Led engineering for Glider.ai, a real-time candidate-evaluation SaaS platform combining Node.js, MongoDB, Meteor.js, and Python NLP.

Tribune Digital Ventures (Senior UI Developer, Bengaluru)

December 2013 - February 2015

Rebuilt zap2it.com with Lucene based search and advertising infrastructure tuned for performance and SEO to meet high traffic spikes.

Flipkart (UI Developer, Bengaluru)

February 2013 - November 2013

Built high-concurrency Node.js services and a BFF-powered Order Management platform integrating catalog, pricing, delivery, and messaging systems.

Dell International Services (Javascript Developer, Bengaluru)

April 2012 - February 2013

Built sub-100ms client-side experimentation and personalization experiences across global Dell domains.

Wipro (Frontend Developer, Bengaluru)

August 2008 - April 2012

Built mobile UI and OS-level interface components for Toshiba's Windows Mobile platform and frontend modules for Dish.com.

SELECTED PROJECTS

Hands-on projects exploring AI systems, platform architecture, developer tooling, and advanced browser-based applications.

Dhando — AI-Assisted CRM for Small Businesses (work-in-progress)

Building a conversation-first CRM for owner-operated Indian SMBs.

Designed and building a 160+ component React/TypeScript design system with Storybook and automated WCAG 2.1 AA validation.

Designed runtime white-label theming with derived design tokens and contrast validation, eliminating per-tenant builds.

Designed a Go/PostgreSQL API with row-level-security multi-tenancy, using OpenAPI 3.1 to generate the typed TypeScript client.

Built responsive abstractions across 25 list surfaces for a mobile-first PWA spanning a 80-screen product.

Developing through an agentic software-development workflow integrating Figma, MCP, and coding agents.

Stad-Ops — AI-Assisted Incident Command Platform (pre-launch)

Real-time incident-management platform for stadiums and large venues.

Designed dual-channel incident intake combining structured mobile reporting with voice transcription using OpenAI Whisper.

Integrated Gemini-based categorization, resolution assignment, and dispatch recommendations with human confirmation in the loop.

Built venue visualization, staff assignment, multi-role permissions, real-time state synchronization, and audit logging.

Casa-Craft: 2D-to-3D Interior Design Quoting Visualizer (pre-launch)

A platform for converting floorplans and visualizing interiors

Browser-based tool converting 2D floor layouts into interactive 3D visualizations with component selection and live quoting, built on React Router and Three.js with a Docker-first development strategy.

Remove-BG: Client-Side Image Background Removal

github.com/jagadish-k/remove-bg | jagadish-k.github.io/remove-bg

Built a browser-based tool removing checkered transparency patterns, solid backgrounds, and shadows from images using OpenCV.js compiled to WebAssembly, keeping all processing local so images never leave the client.

Implemented tolerance-based detection, manual color selection, magnified preview, and transparent PNG export.
